

ANIMATED SCREEN OBJECT FOR ANNOTATION AND
SELECTION OF VIDEO SEQUENCES

ABSTRACT OF THE DISCLOSURE

5 A simple display of items from a list, which changes in synchrony with the
corresponding video display, and permits simple navigation under user control. The display
includes three control objects positioned below a video frame window on a display screen. A
middle displayed object is located in a focus position and corresponds to the video segment
currently being played in the video window. When play of the segment is complete, the
10 object located to the right of the focus position moves and displaces the middle displayed
object, most recently displayed within the focus position, to indicate a forward progression
within the viewed video sequence.
